

NFX Package Manager

Professional User Guide

Introduction

NFX (Nova Pheonix Package Manager) is a modern command-line package manager designed to simplify software installation, upgrading, searching, and package management within the Pheonix Studios Ecosystem.

It provides a fast and organized way to manage packages directly from the terminal while supporting:

- Package installation
 - Parallel downloads
 - Package upgrades
 - Local repositories
 - Cache management
 - Package searching
 - Configuration generation
-

About NFX

Product Information

Field	Value
Name	NFX
Full Name	Nova Pheonix Package Manager
Version	1.0.0
Developer	Pheonix Studios
Platform	Windows / Linux
Architecture	x86_64

Field	Value
Mode	Command Line Interface (CLI)

Basic Command Structure

NFX commands follow this structure:

```
nfx <option> <arguments> [--flags]
```

Example

```
nfx install pdasm
```

This command installs the pdasm package.

Getting Started

Opening NFX

Open:

- Terminal (Any linux terminal)
- Windows Terminal / Command Prompt
- PowerShell

Navigate to the NFX directory using 'cd' command or any other.

Then run:

```
nfx help
```

Core Commands

1. Install Packages

Install a single package:

```
nfx install <package>
```

Example

```
nfx install pdasm
```

Install Multiple Packages

```
nfx installs pac pdasm pheonix-engine
```

Install from Local Repository or URL

```
nfx install <path_or_url> --local
```

2. Upgrade Packages

Upgrade a single package:

```
nfx upgrade <package>
```

Example

```
nfx upgrade pdasm
```

Upgrade All Packages

```
nfx upgrade --all
```

Upgrade Multiple Packages

```
nfx upgrades pdasm pac pheonix-engine
```

3. Remove Packages

Remove a package:

```
nfx remove <package>
```

Example

```
nfx remove pdasm
```

Remove Multiple Packages

```
nfx removes pdasm pac pheonix-engine
```

4. Search Packages

Search for a package:

```
nfx search <query>
```

Example

```
nfx search pac
```

Search Multiple Queries

```
nfx searches pac pdasm pheonix
```

Case Sensitive Search

```
nfx search PAC --case
```

Show All Packages

```
nfx search --all
```

5. Package Information

Display information about installed packages:

```
nfx info <package>
```

Example

```
nfx info pdasm
```

Additional Information Commands

Command	Purpose
nfx info <package> --license	Show package license
nfx info <package> --author	Show package author
nfx info <package> --doc	Show package documentation
nfx info <package> --desc	Show package description
nfx info <package> --modified	Show last modified date

NOTE: You can use multiple flags together like – nfx info <package> --license – author

6. Package Database Management

Update Package List

```
nfx update
```

This updates the package database and repository metadata.

7. View Installed Packages

```
nfx get-packages
```

Sort Packages

```
nfx get-packages --sort=time
```

Available Sorting Modes

Mode	Description
alpha	Alphabetical order
rev-alpha	Reverse alphabetical
time	Sort by installation time

Mode	Description
rev-time	Reverse time order
size	Sort by size
rev-size	Reverse size order

Limit Results

`nfx get-packages max-count=10`

8. Cache Management

Show Cache Size

`nfx cache-size`

Clean Cache

`nfx cache-clean`

This removes temporary cached package files.

9. Configuration System

Show Current Configuration

`nfx config`

Generate Default Configuration

`nfx genconfig`

Overwrite Existing Configuration

`nfx genconfig --overwrite`

Adding NFX to PATH

Adding NFX to the PATH environment variable allows you to run nfx from any terminal location.

Step-by-Step for Windows

1. Press Windows + S
2. Search for:
Environment Variables
3. Open:
Edit the system environment variables
4. Click:
Environment Variables
5. Under **User Variables**, select:
Path
6. Click:
Edit
7. Click:
New
8. Add your NFX directory:
C:\Users\<username>\Downloads\NFX\bin\windows\x86_64\dist
9. Save changes
10. Restart the terminal

Step-by-Step for Linux

1. Open your Shell's startup file, for this example we are using "bash", so open
<home folder>/.bashrc
2. add a new line
3. type "export PATH="\$PATH:<path to NFX directory>/bin/linux/x86_64/dist
4. Save and close
5. Either restart Shell/Terminal or type "source ~/.bashrc"

Real-World Workflow Example

Installing Development Tools

Step 1 — Update Package Database

`nfx update`

Step 2 — Search for Packages

`nfx search pdasm`

Step 3 — Install Required Tools

`nfx installs pdasm pac`

Step 4 — Verify Installed Packages

`nfx get-packages`

Step 5 — Upgrade Everything Later

`nfx upgrade -all`

Best Practices

- Regularly update package lists
 - Clean cache periodically
 - Use parallel installs for faster setup
 - Keep packages upgraded for security and performance
 - Use package info commands before installing unfamiliar packages
-

Troubleshooting

Command Not Found

Problem

'nfx' is not recognized as an internal or external command

OR

No such file or directory 'nfx'

Solution

Add the NFX directory to the Windows/Linux PATH environment variable.

Permission Errors

Run terminal as Administrator.

Package Not Found

Try updating the package database:

nfx update

Then search again:

nfx search <package>

Why NFX Matters

NFX simplifies package management into a clean and efficient workflow.

Instead of manually downloading software from websites, NFX enables:

- Faster software setup
- Better dependency management

- Easier upgrades
- Organized development environments
- Scalable automation workflows

It transforms software management into a modern CLI-driven experience for Pheonix Studios Ecosystem Packages.

Conclusion

NFX is a lightweight yet powerful package management solution focused on speed, organization, and simplicity.

Whether you are:

- A developer
- A student
- A system administrator
- A power user

NFX helps streamline software management through efficient command-line tooling.

Quick Command Reference

Action	Command
Help	nfx help
Update package list	nfx update
Search package	nfx search <pkg>
Install package	nfx install <pkg>
Install multiple	nfx installs <pkg1> <pkg2>
Upgrade package	nfx upgrade <pkg>
Upgrade all	nfx upgrade all
Remove package	nfx remove <pkg>

Action	Command
Show installed packages	nfx get-packages
Show config	nfx config
Generate config	nfx genconfig
Clean cache	nfx cache-clean
Show cache size	nfx cache-size
